

**TOP QUALITY PETROLEUM EQUIPMENT · SALES · SERVICE · INSTALLATION**

**Hafer Equipment is pleased to announce we are offering a new Preventive Maintenance Program for ULSD & Bio-Fuel locations to our valued customers.**

### **NEW FUELS= DIFFERENT RULES**

Changes in Ultra-Low Sulfur Diesel (ULSD) and Bio-fuels come with a new set of rules in storing these types of fuels. Because ultra-low sulfur diesel is different chemically than the prior diesel fuels in history, there are certain steps that need to be taken to minimize the negative impacts that can occur from that difference. Our primary concern is to eliminate the premature failure of system components and the clogging of system filters due to the accelerated corrosion that WILL occur. The primary chemical difference that contributes to the corrosion issue is that the lower sulfur content increases the fuels affinity for moisture and reduces the fuels resistance to microbial growth. As a result we are recommending this program that we will implement for our valued customers. Our treatment bonds with the tank, coats it and all components installed in tank, this will help eliminate the corrosion and all your costly repair expenses.

## **Our Preventive Maintenance Program for ULSD**

### **Extreme problem locations:**

We recommend the tank to be cleaned, "which we can provide for our customers", a monthly addition of our #1032 fuel inhibitor for one year and then after a quarterly treatment this will help keep the issues from arising again and help eliminate the corrosion that causes your components to fail prematurely.

### **All other locations:**

We recommend a monthly treatment of our #1032 fuel inhibitor for the 1<sup>st</sup> year and then a quarterly treatment thereafter. This will help eliminate issues for the future and help keep your components from premature failure.

As all our customers know there is an issue, at this current time there is a blend of 2% bio in the ULSD soon that will increase and you will be experiencing even a greater amount of issues. Do not let your equipment corrode prematurely and let your site filters fail, flow rates decrease, continuous service calls and lose your customer status. This simple plan will help eliminate your issues and expensive costs before the problem occurs, protect your investment.

Our preventative maintenance program is the key to help keep your fuel and tank in a superior quality condition.
